Can I run SBClient on Windows Vista or Windows 7 while running the AERO Theme?

Yes, but you will need to disable the AERO Theme for the SBClient program window.

Example of Issue with AERO Theme

As of SBClient Versions 5.4.4 and 6.0.1 Rocket Software does not support the AERO Theme.
You will discover that menus will disappear when escaping from a GUI form back to the menu.
The following 3 screen shots demonstrate this:

Fig 1.   Running a form with the menus shown in the background.

Fig 2   When you escape from the form the menu will disappear.

Fig 3.   Moving your mouse across the blank menu will cause menu options to re-appear as the options are given focus.

Solution:
The current solution to this problem is to disable the AERO while the SBClient session is running.

1. Right click on the SBClient Icon used to launch SBClient.
2. Select the 'Properties' option.
3. Select the 'Compatability' Tab.
4. Check the settings box for 'Disable Desktop Composition'.
